

IX. AGE ASSIGNMENT OF THE SILTSTONE FRAGMENTS DREDGED

By Shiro Hasegawa,* Toyosaburo Sakai,* Makoto Okamura*
and Toshiaki Takayama**

During the present cruise, dredge sampling was carried out at 34 sites and 24 siltstone samples were obtained from 19 sites (Table IX-1). Siliceous microfossils were found in all samples, and calcareous in four samples.

We report the age of 15 samples from 13 sites, determined by planktonic foraminifera, calcareous nannoplankton and Radiolaria. Planktonic foraminifera and calcareous nannoplankton found in three samples are shown in Table IX-2, and occurrences of some radiolarians which are used to determine the age are shown in Table IX-3.

In this report, three foraminiferal, two nannoplankton and 12 radiolarian events or datum planes are used to know the relation with the paleomagnetic time scale (Figs. IX-1 ~ 3). These events or datum planes are selected from MAIYA *et al.* (1976) [planktonic foraminifera], GARTNER (1973) [calcareous nannoplankton], and HAYS (1970), KLING (1973), SAITO *et al.* (1975) [Radiolaria]. Then, the age of samples is assigned after the correlation to the paleomagnetic time scale with geochronological age proposed by BERGGREN and VAN COUVERING (1974). These correlation are shown as follows:

Brunhes Normal Epoch-Matuyama Reversed Epoch Boundary (0.7 m.y.)*****Late-Early Pleistocene Boundary.

Base of Olduvai Event in Matuyama Reversed Epoch (1.6–1.8 m.y.)*****Pleistocene-Pliocene Boundary.

Gauss Normal Epoch-Gilbert Reversed Epoch Boundary (ca. 3.3 m.y.)*****Late-Early Pliocene Boundary.

Gilbert Normal Epoch-Epoch 5 (Normal) (ca. 5.0 m.y.)*****Pliocene-Miocene Boundary.

Judging from the occurrences of the selected species, the age of the dredged siltstones is assigned within the interval shown as lines in Fig. IX-4. In these siltstones, it is estimated that the age of one sample D172 is in early to middle Pliocene, and the others are more younger than the latest Pliocene. Among these, 3 samples (D142, D143–3 and D160) are in late Pleistocene.

Although many diatoms are found in all of the samples, no analysis was made. Examination of diatom flora should give more confidence for the results in this report, and may suggest the age of the 9 samples remained.
