DART Mooring System

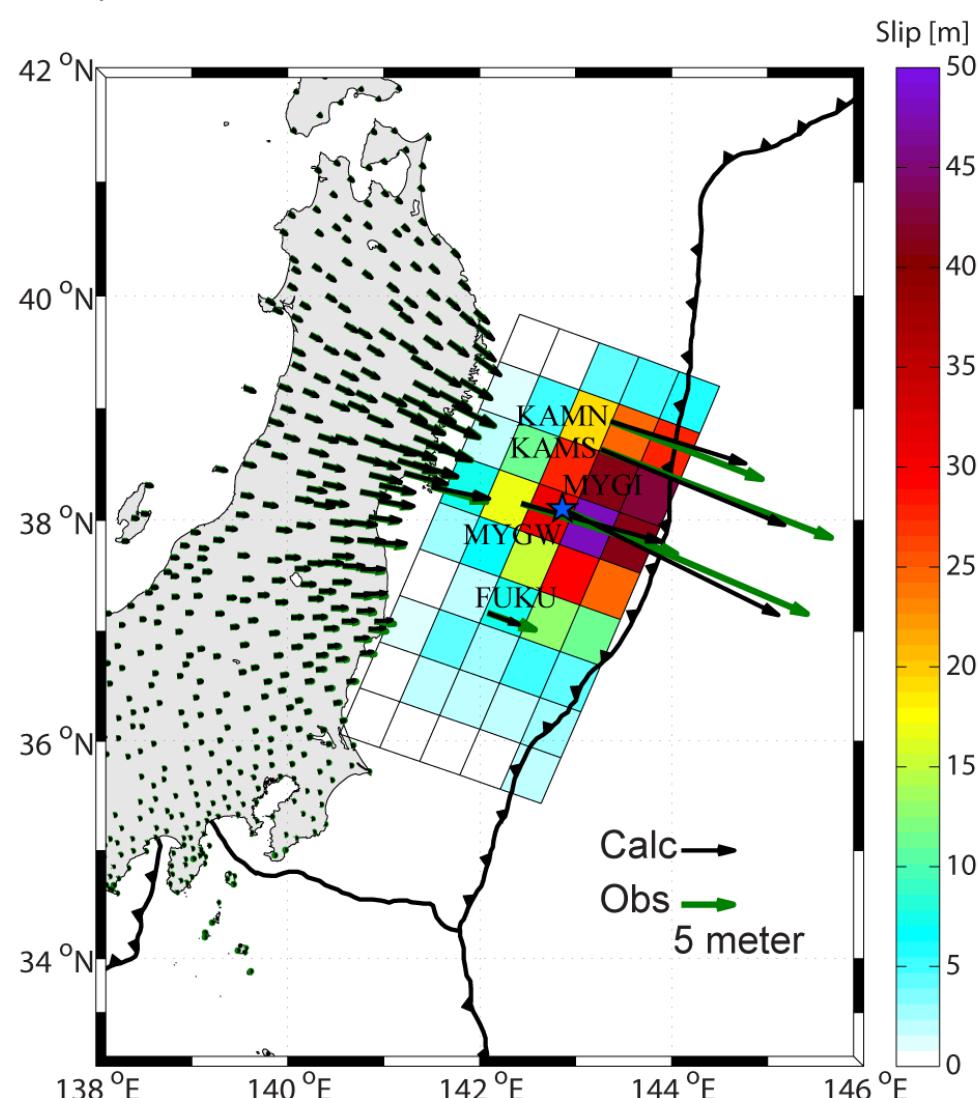

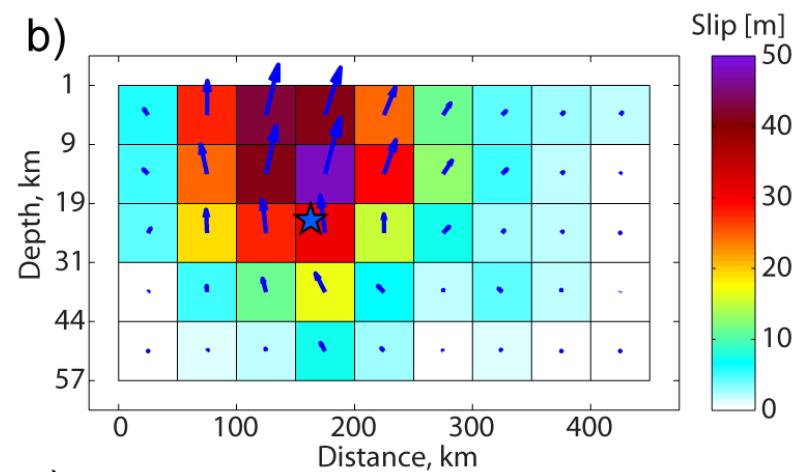

**Ocean bottom
pressure gauges with
buoys (DART)**

Slip distribution estimated using the joint inversion of co-seismic crustal deformation and tsunami waveforms

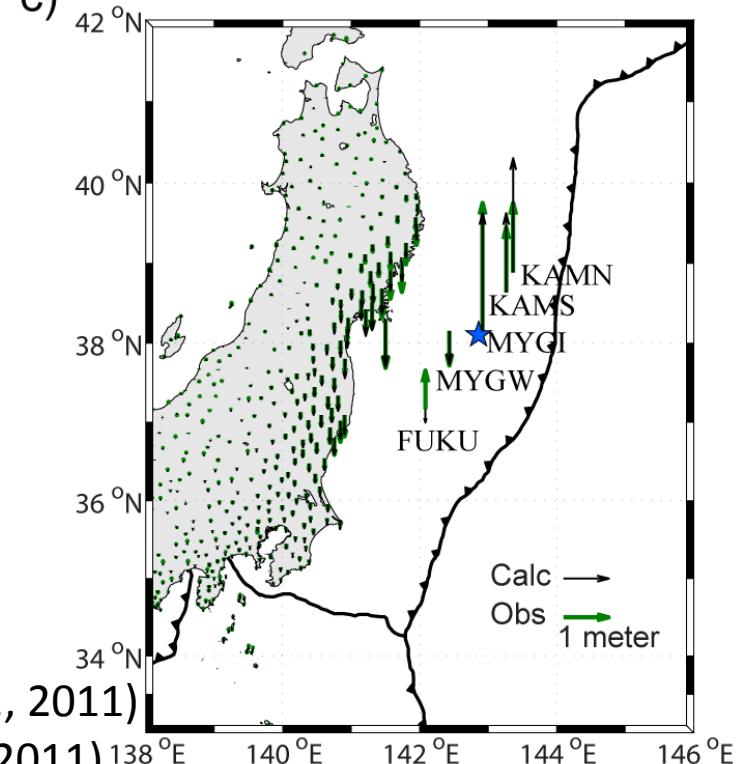

a) tsunami waveforms

b)

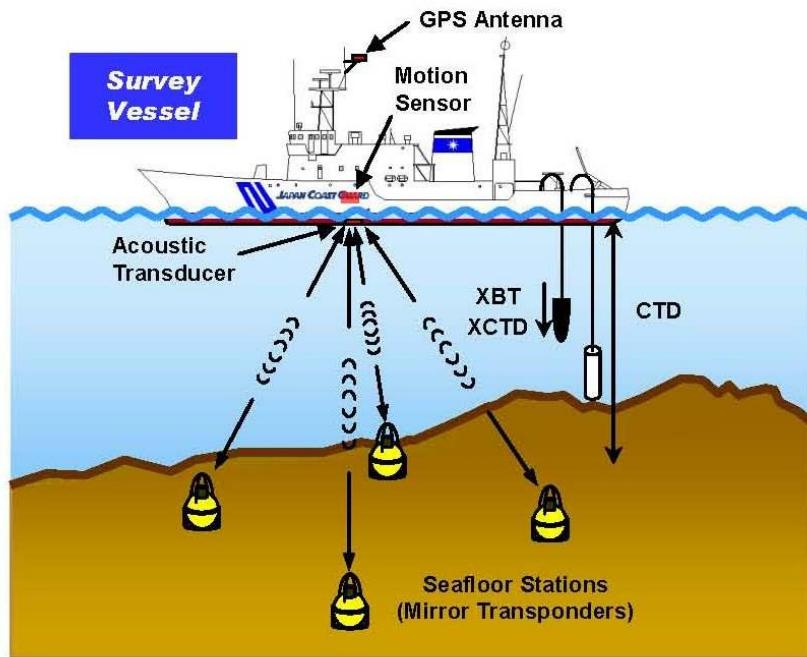

c)

Co-seismic deformation observed by GPS (Ozawa et al., 2011)

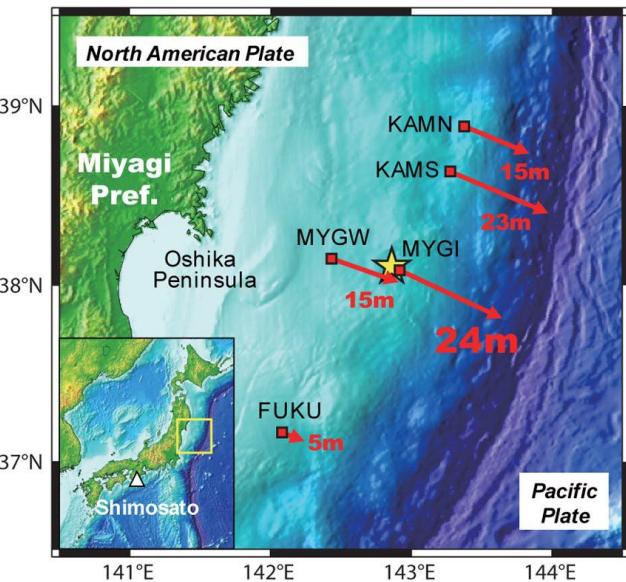

Co-seismic deformation at ocean bottom (Sato et al., 2011)

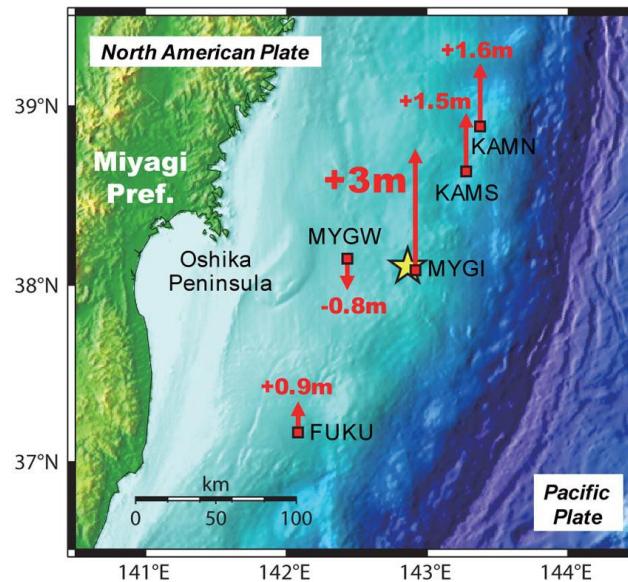

Ocean Bottom Crustal Deformation Observation

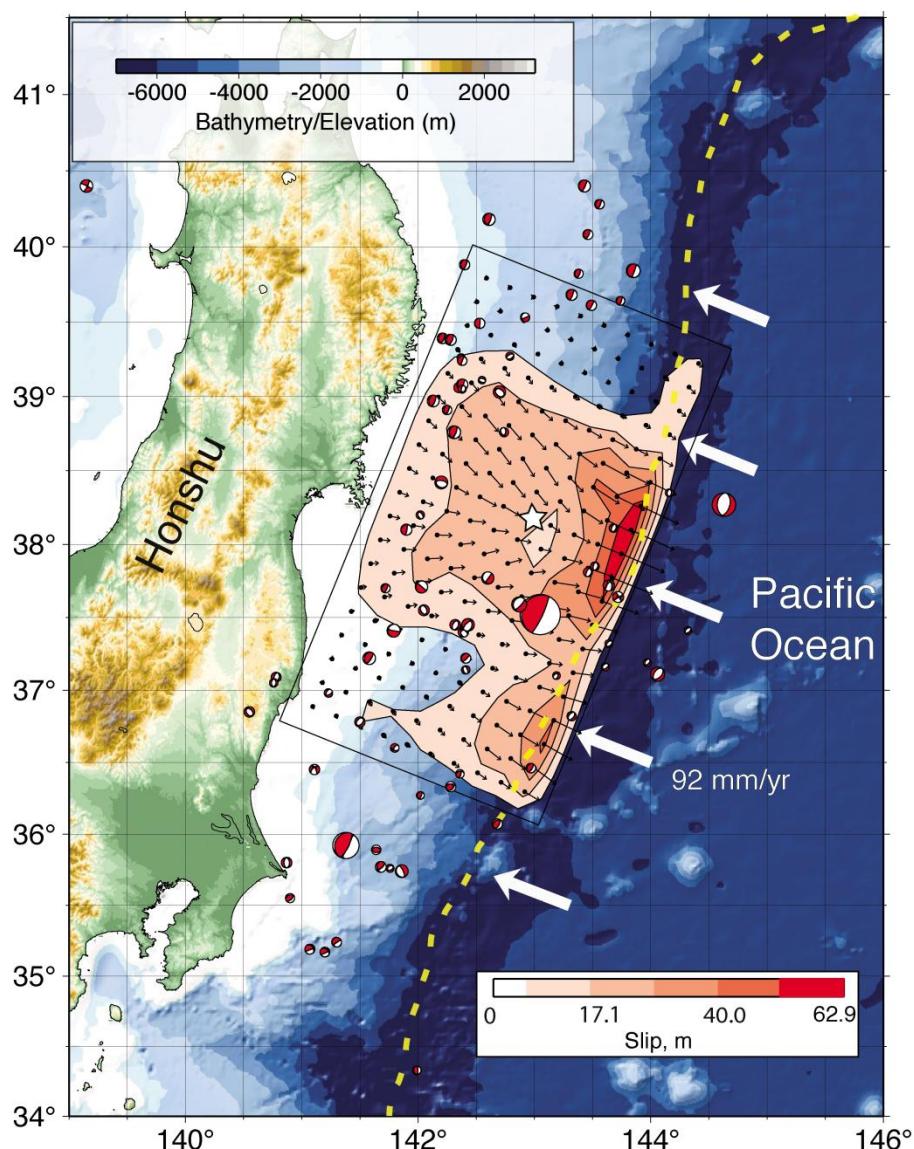

Sato et al. (Science 2011)

(A) Horizontal displacements

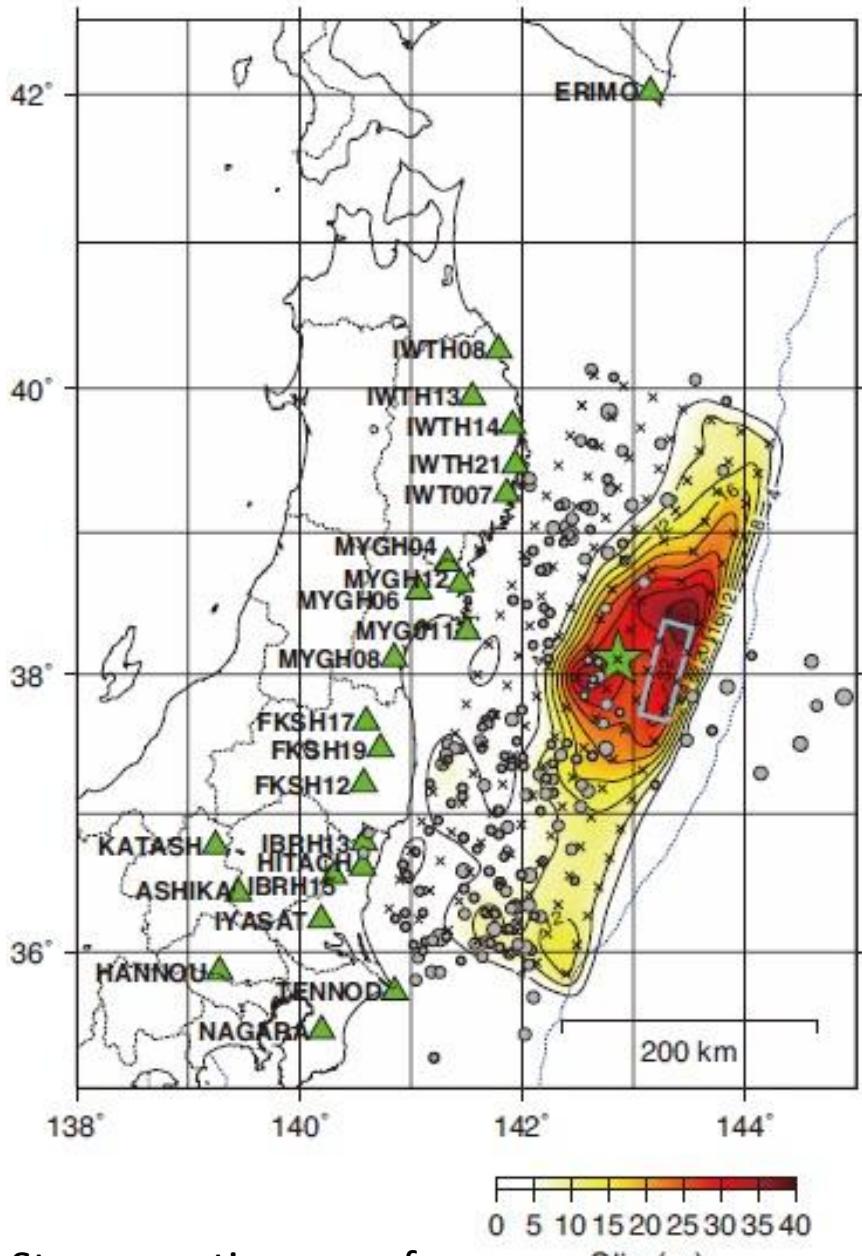

(B) Vertical displacements

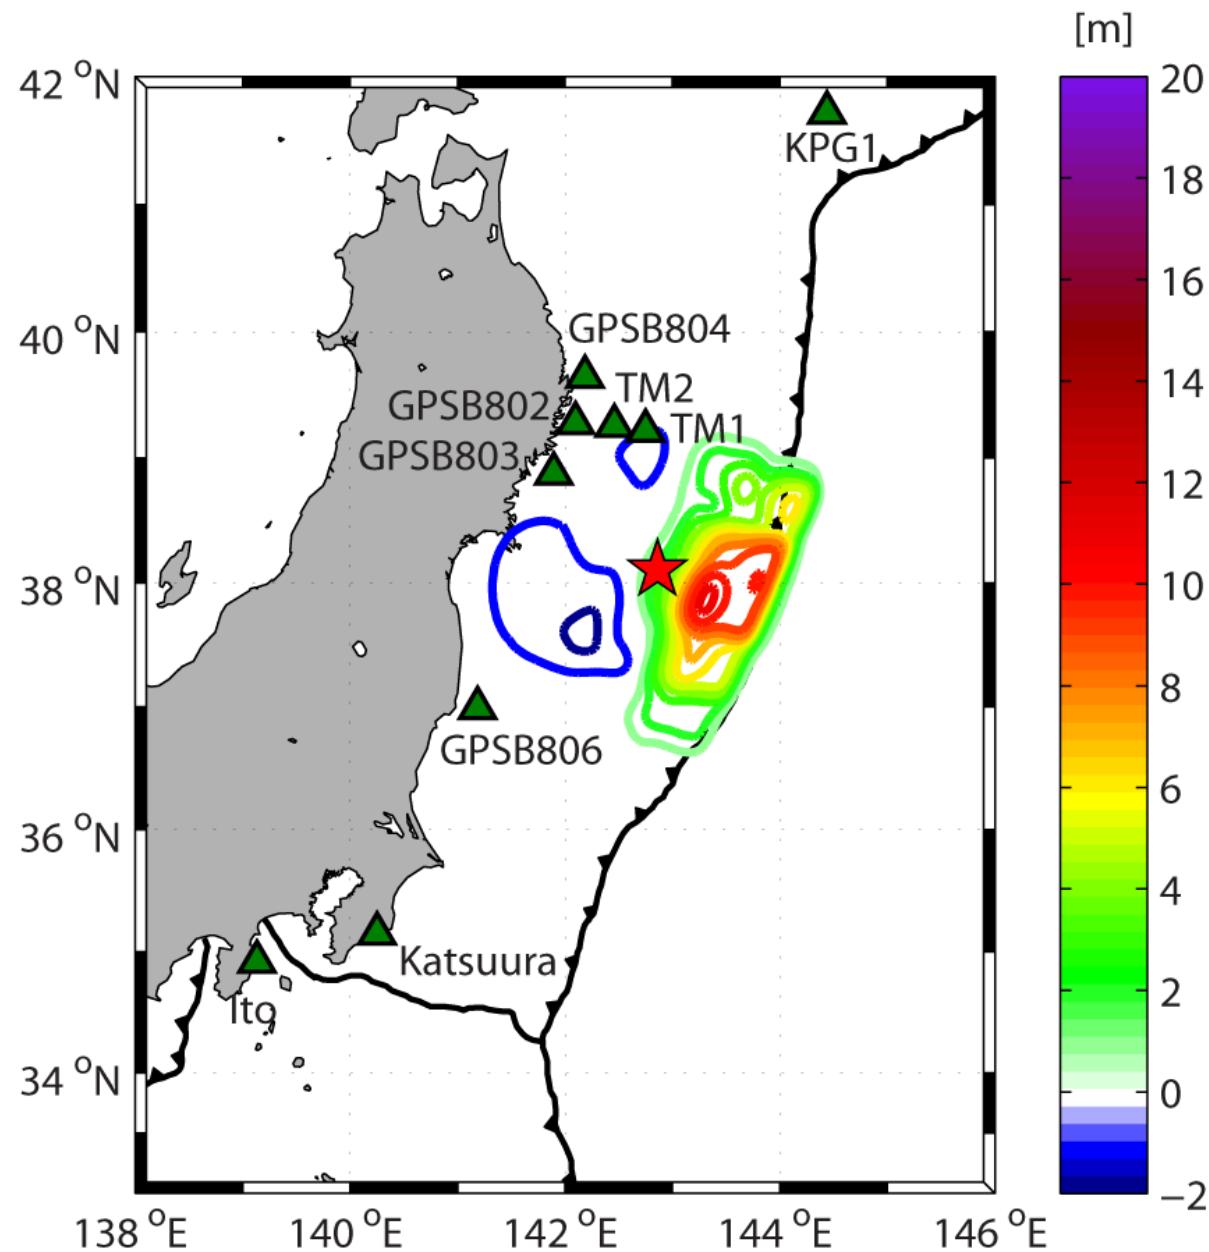

Telesismic waveforms analysis
Lay et al. (2011)

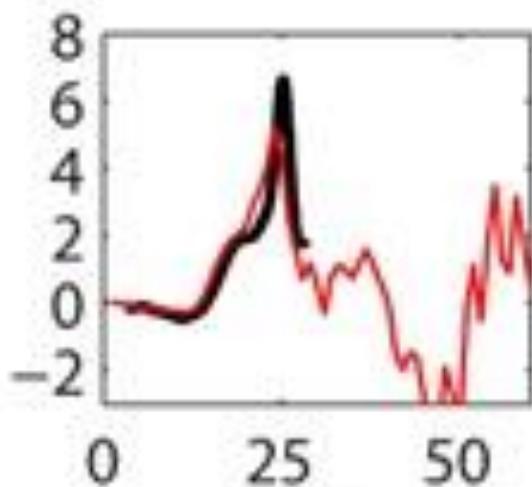

Strong motion waveforms
Yoshida et al. (2011)

Vertical deformation computed from the estimated slip distribution

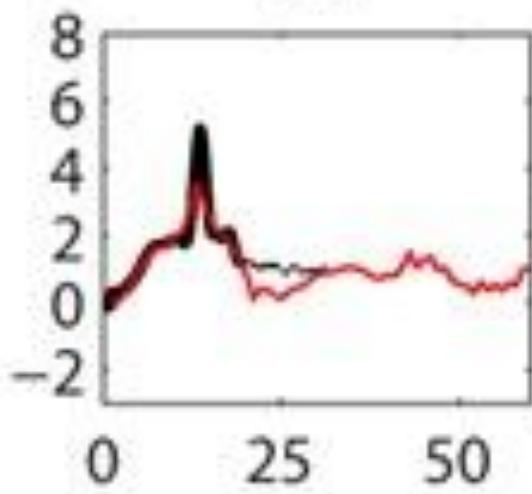

Comparison of observed and computed tsunami waveforms

Time, min

Additional uplift model in the accretionary prism near the trench
 (Tanioka and Seno, 2001)

1) Model A

2) Additional uplift

Model A

ocean surface

ocean bottom

Model A for the 1896 Sanriku tsunami earthquake used by Tanioka and Seno (2001).

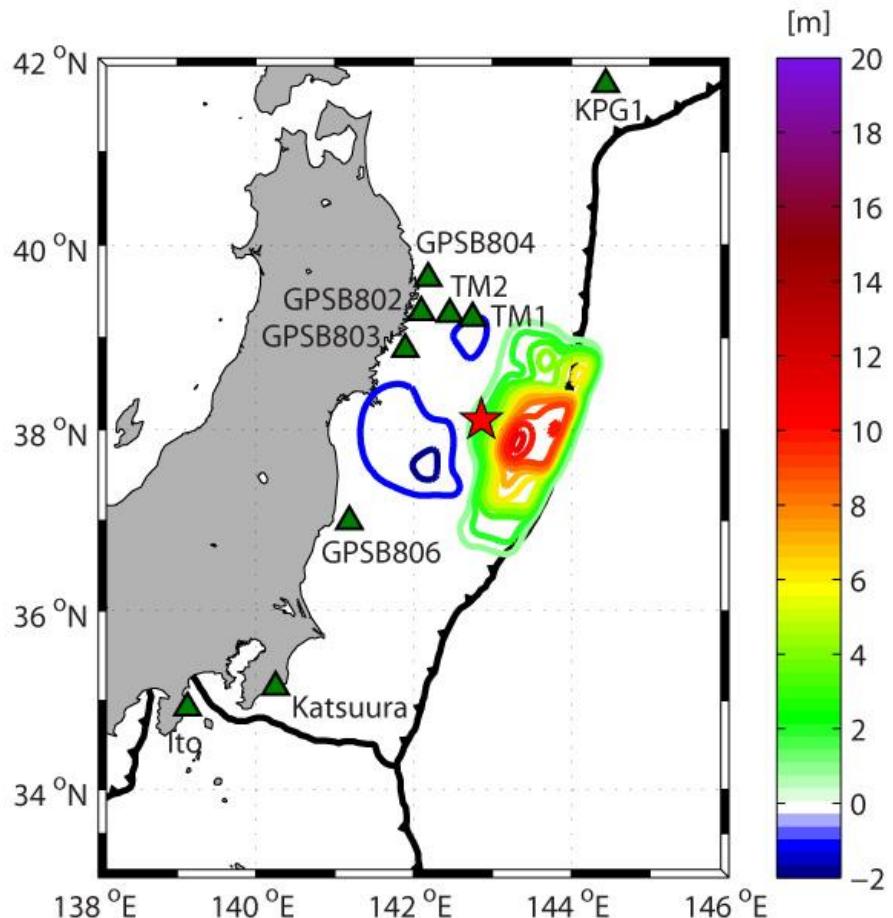

Horizontal deformation was estimated from slip distribution.

$$\theta=50^\circ, \text{ width } 1.5\text{km}$$

Vertical deformation computed from the estimated slip distribution

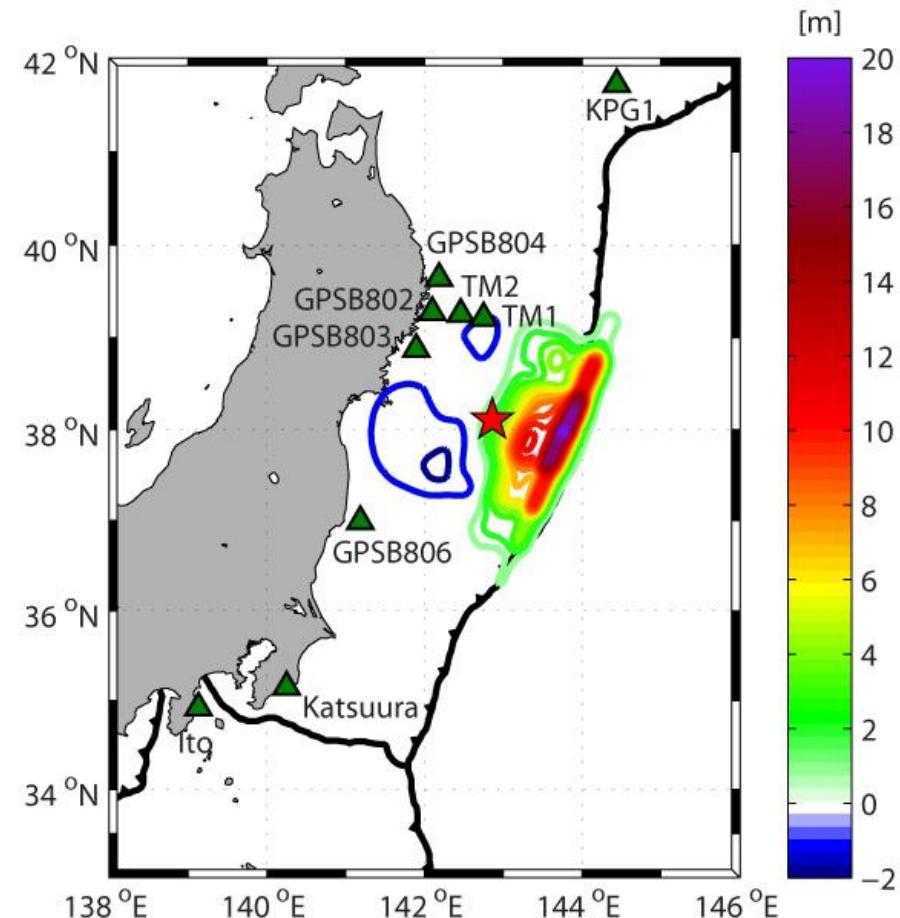

a)

Only from slip distribution

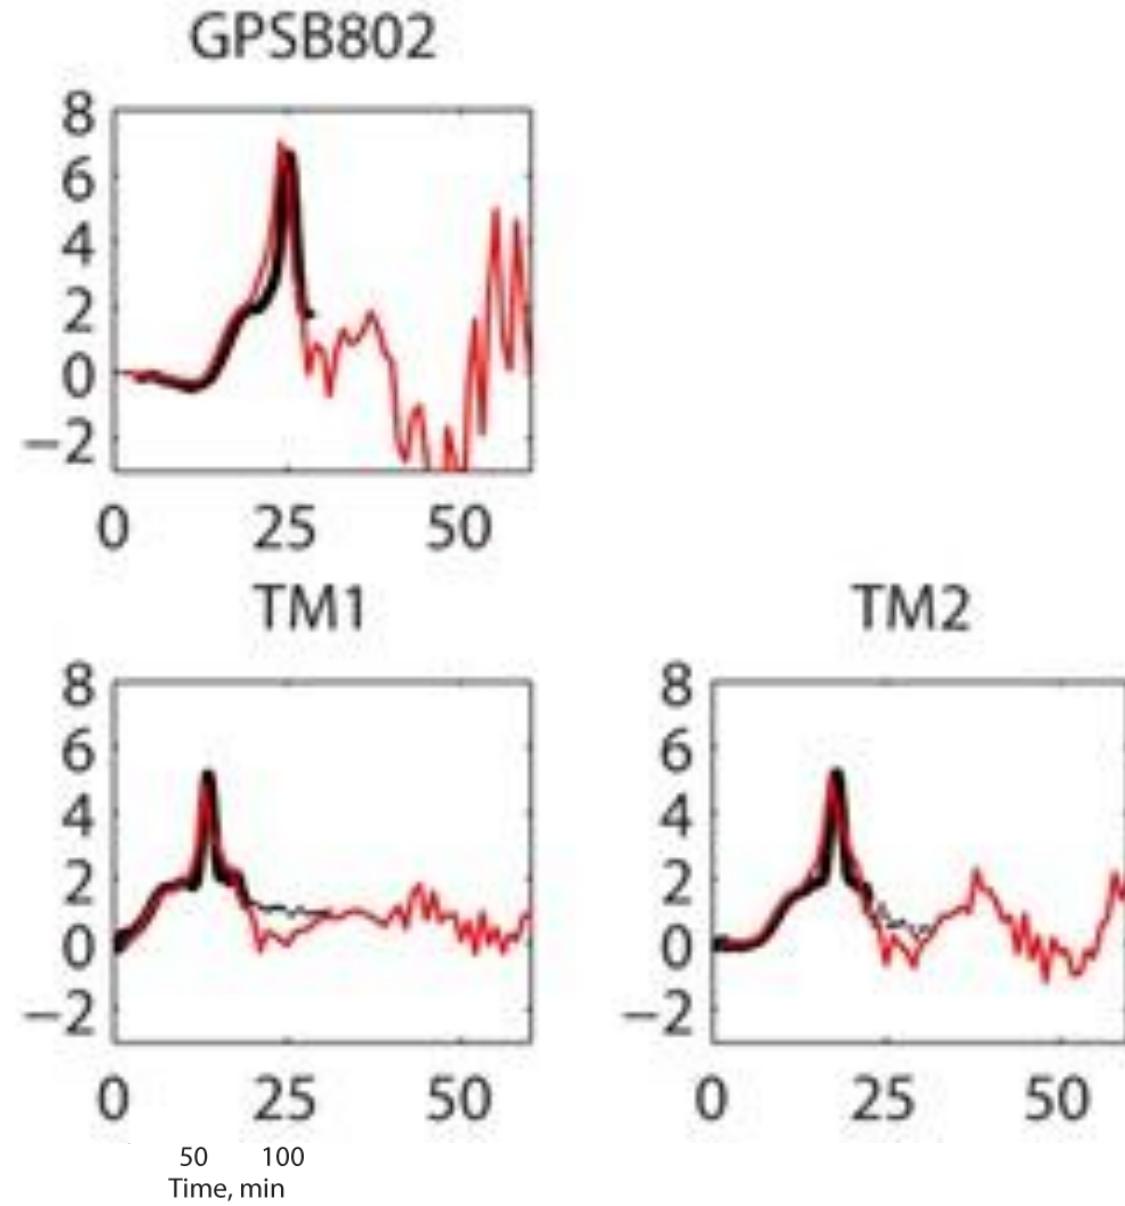

b)

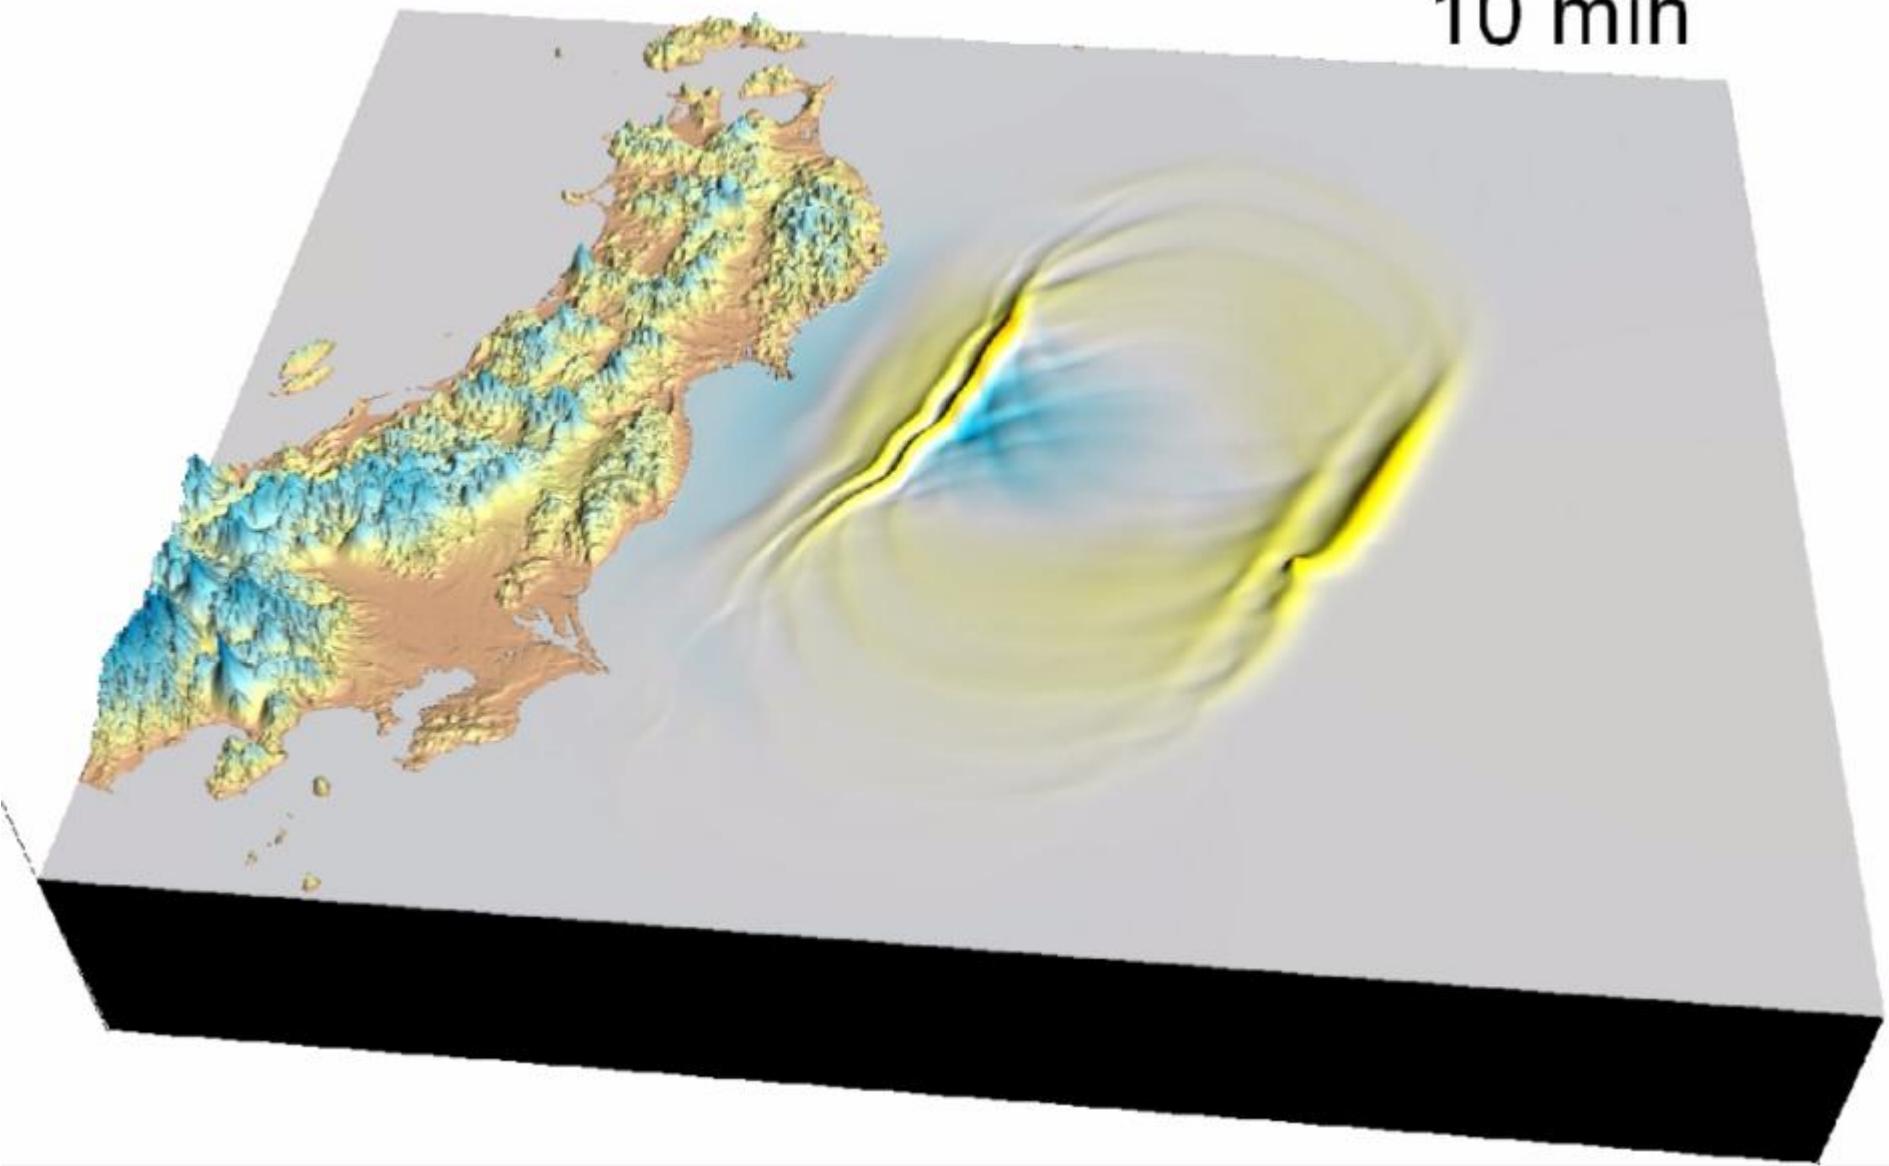

With additional uplift

Minami-Sanriku (Aug. 5th, 2009)

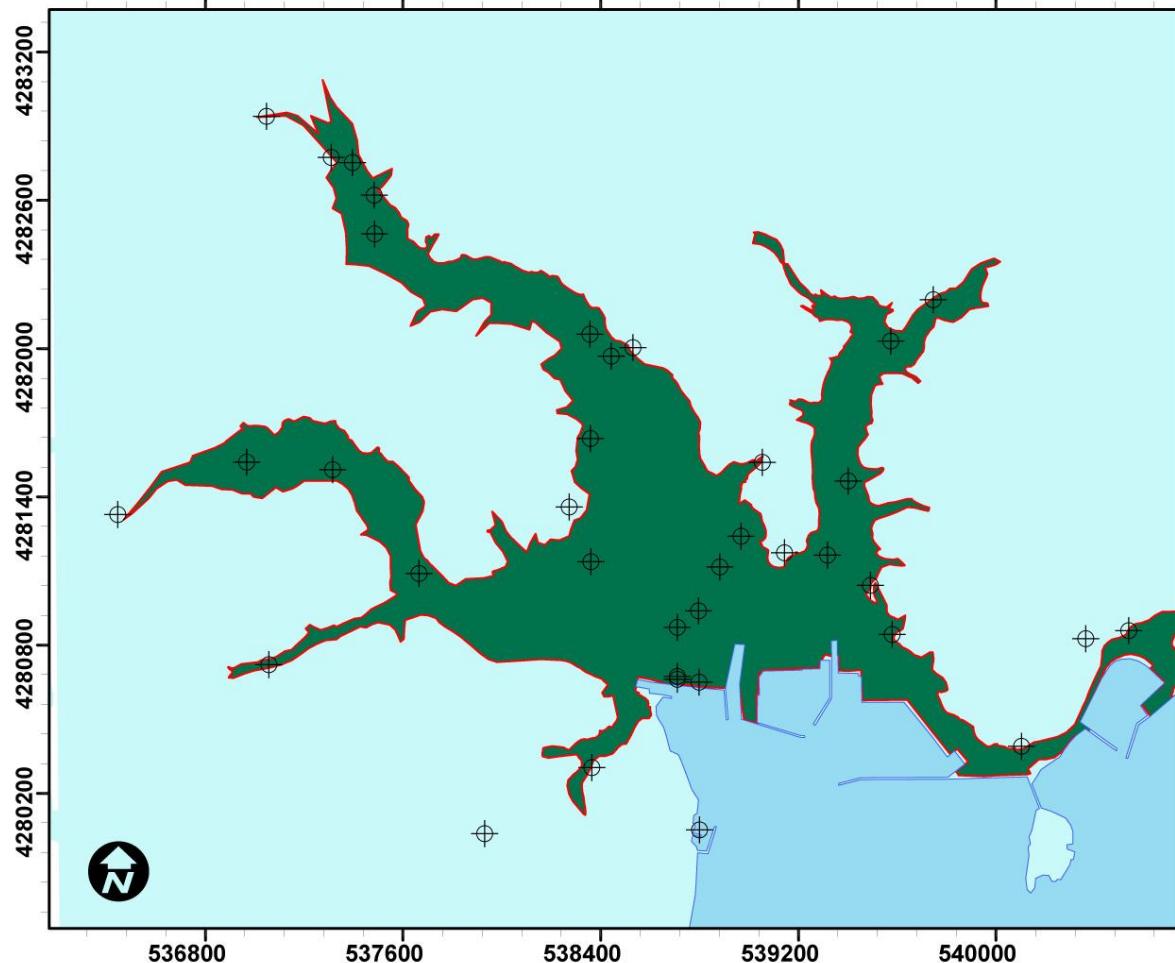

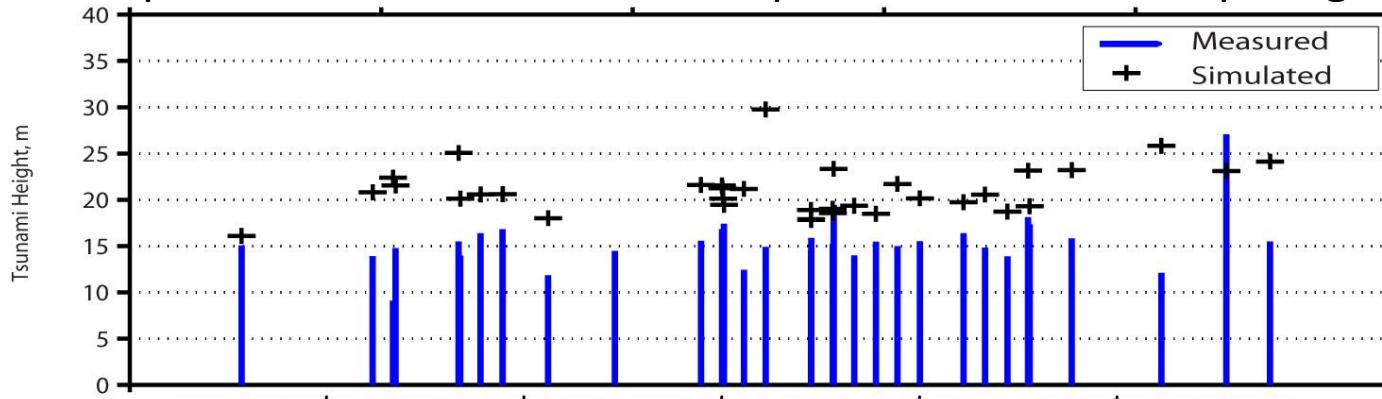

Tsunami inundation computation result at Minami-Sanriku

Comparison of observed and computed tsunami inundation area

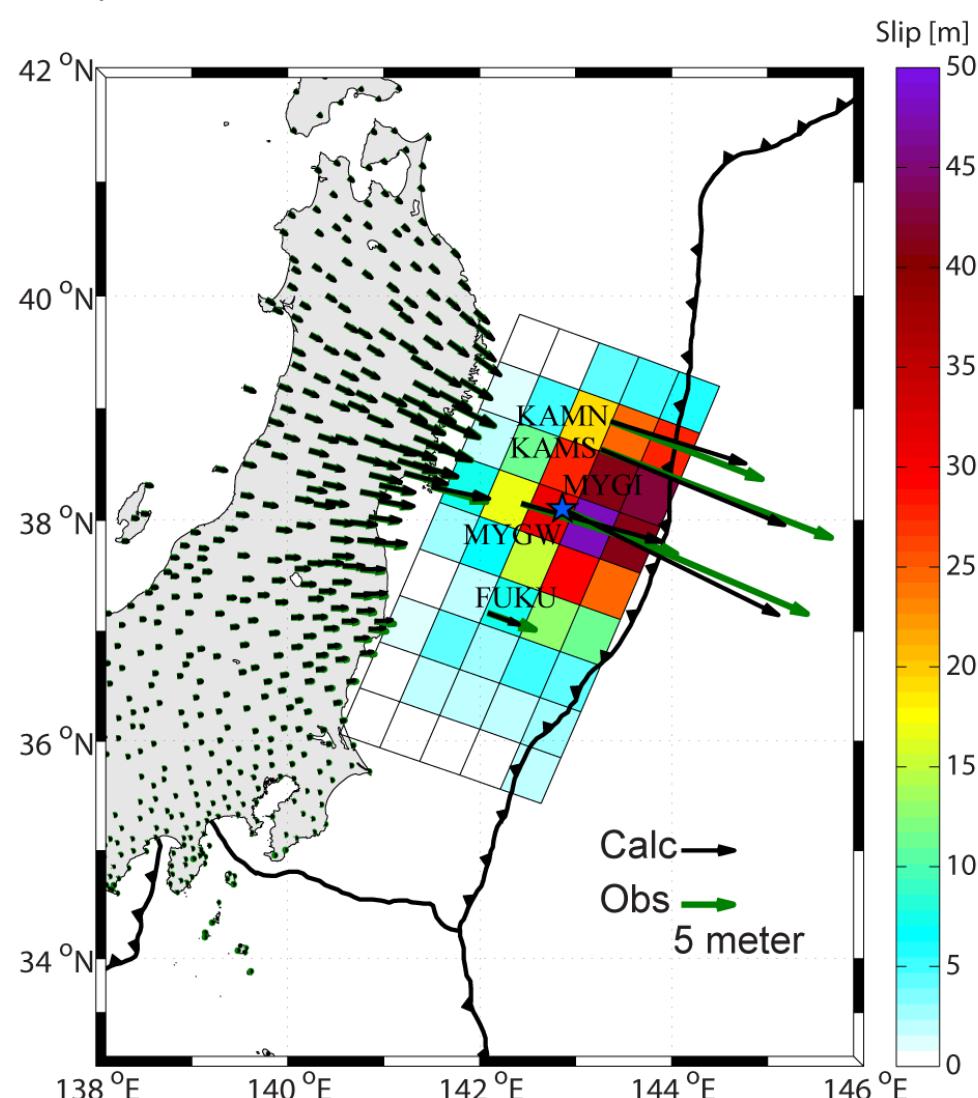

Comparison of observed and computed tsunami run-up heights

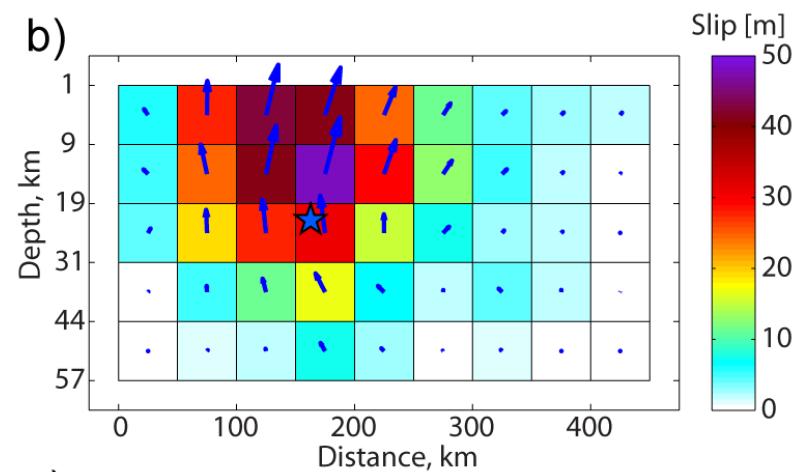

Slip distribution estimated using the joint inversion of co-seismic crustal deformation and tsunami waveforms

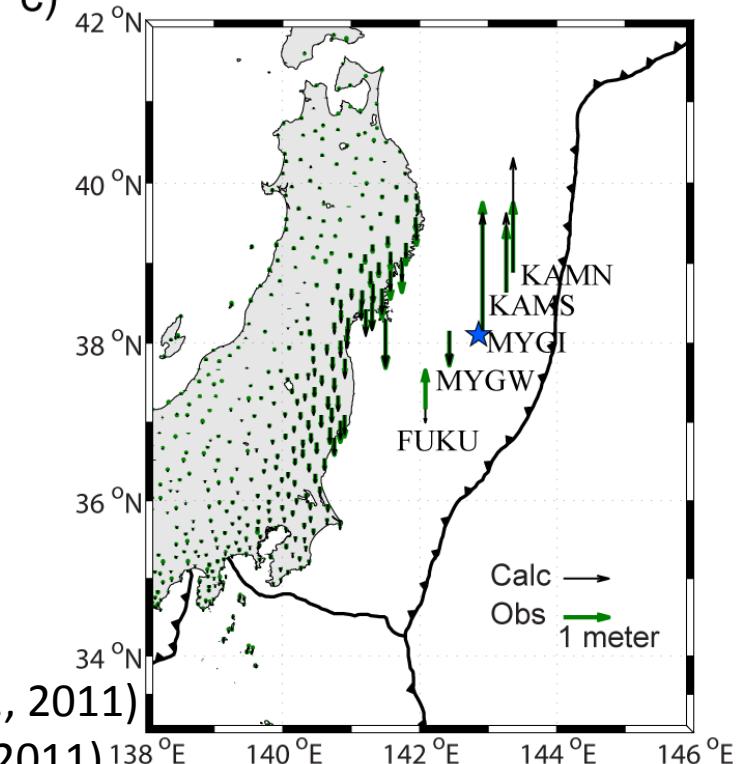

a) tsunami waveforms

b)

c)

Co-seismic deformation observed by GPS (Ozawa et al., 2011)

Co-seismic deformation at ocean bottom (Sato et al., 2011)

Past Tsunami in Taro, Miyako city

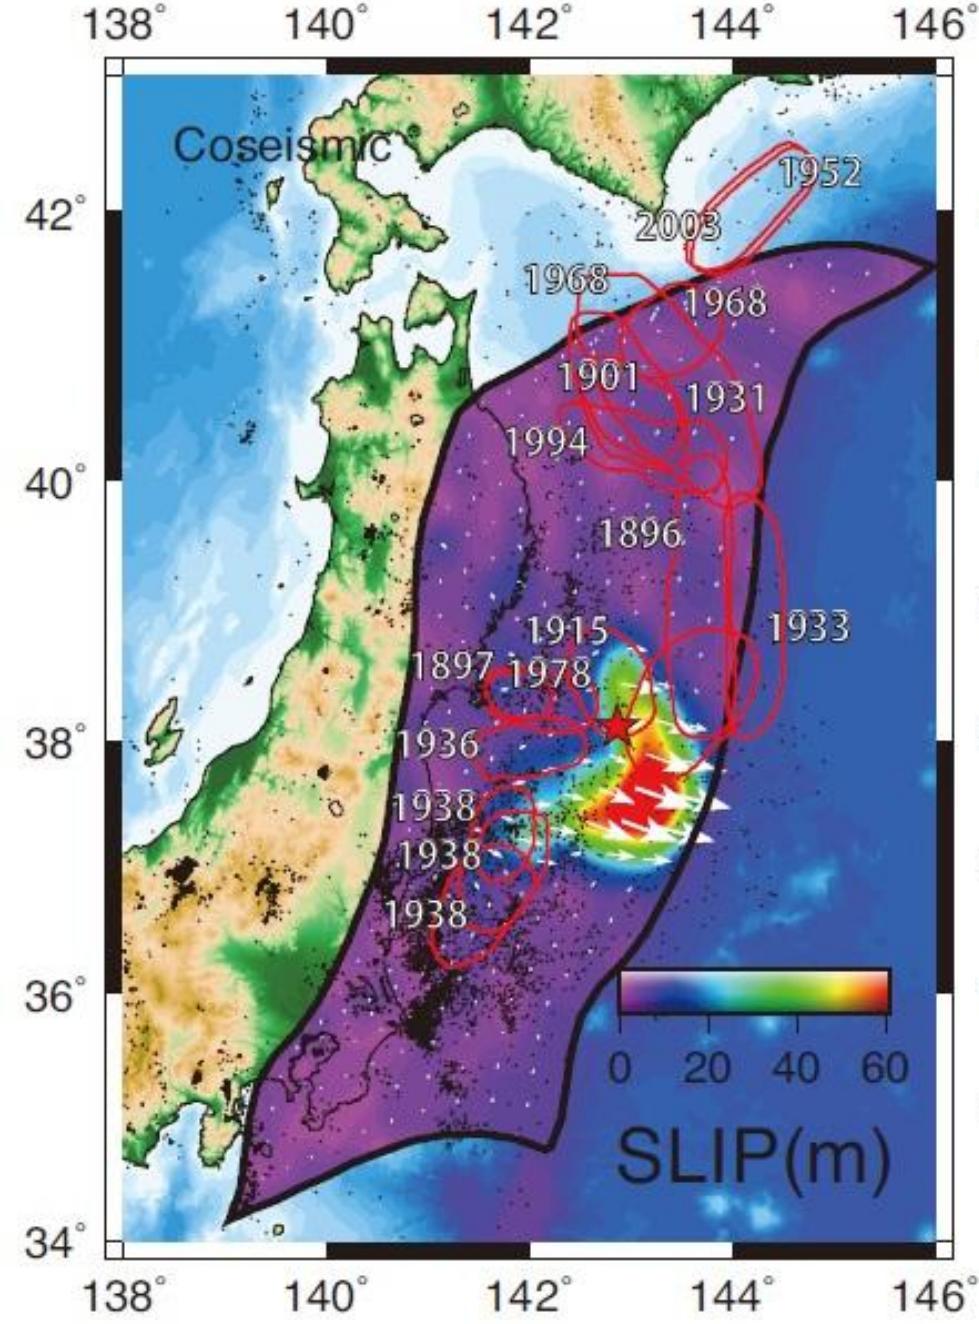

1896 Meiji tsunami: 1867 deaths (out of 2248 residents, or 83%)

1933 Showa tsunami: 972 deaths (out of 4945, or 20%)

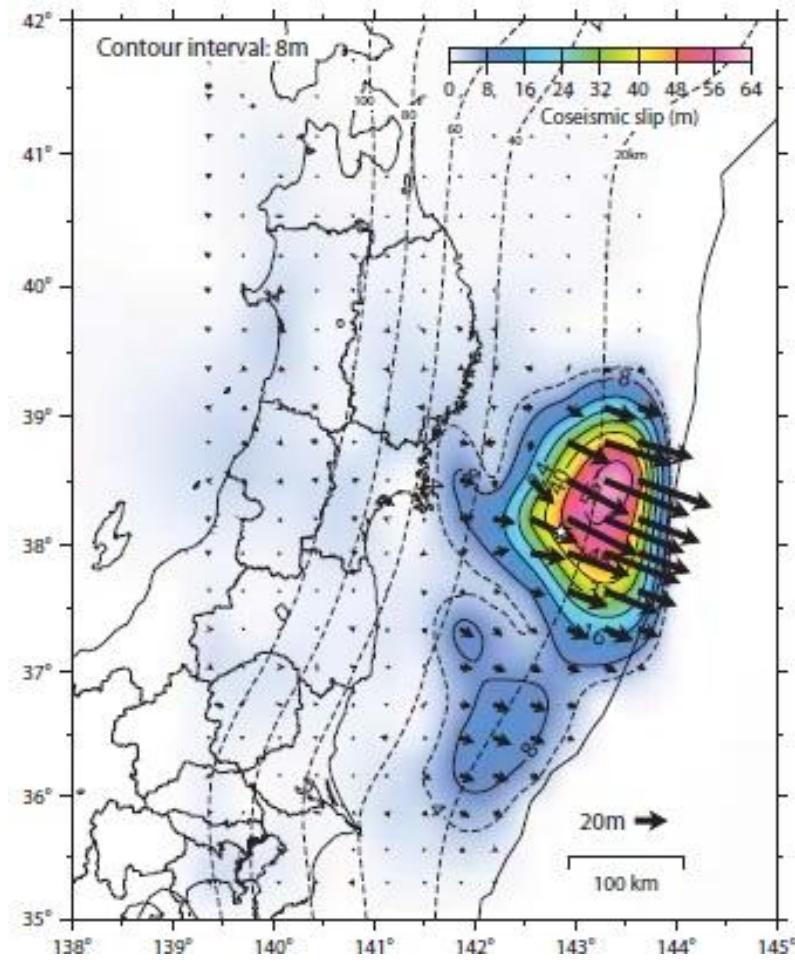

2011 Tohoku-oki tsunami: 230 casualties (out of 4000, or 6%)

10m high 2.5 km long breakwater around Town

南三陸町の津波遡上計算結果 (浸水深)

- ・今後、陸前高田・田老町や宮古など、多くの主要被災地で数値計算を行い実際のデータとの比較を行うことで震源モデルの評価を実施する。
